AB Azospirillum brasilense strain Cd was grown in ammonium-malate-mineral salts medium under various dissolved oxygen tensions. Maximum poly- beta -hydroxybutyrate content was observed under microaerobic conditions and intermediate dilution rates. Highest cell yield and respiration rate were obtained at relatively low oxygen. Protein content was higher at high oxygen levels. Succinate oxidase and succinate dehydrogenase activities were especially high under high oxygen. Four carotenoids were isolated and purified from membranes. In the

presence of diphenylamine which inhibits carotenoid synthesis, the rate of acetylene reduction decreased to 50% of the control. In liquid

cultures, carotenoid synthesis was initiated only after the depletion of NH4Cl when N2 fixing activity became evident.

Carotenoids appeared to protect nitrogenase from oxidative damage. EE110 Agricultural Economics; DD500 Laws and Regulations; DD100 Administration of Agencies and Organizations; CC200 Extension and Advisory

Results obtained from the shake flask cultures indicated that a high concentration of dissolved oxygen was needed for both cell growth and .beta.-carotene synthesis, and the optimal concentration of glucose was found to be in the range of 50-100 g/l. In order to maintain the dissolved oxygen concentration level at higher than 50% of air saturation, pure oxygen was automatically sparged into the medium with air. Foam was controlled by bypassing air from the submerged aeration to the headspace in response to the foam that was caused by Span 20. High agitation speed was found to be detrimental to the cell growth due to shear damage, even though it provided sufficient dissolved oxygen. On the other hand, a low aeration speed caused stagnant regions in the fermentor because of improper mixing. Thus, for the fed-batch operation, agitation speed was increased gradually from 300 to 700 rpm to prevent cell damage at the initial stage of fermentation and to give efficient mixing for a viscous culture broth as the culture proceeded. By controlling dissolved oxygen and foam, a high concentration of .beta.carotene (1,190 mg/l) was obtained in 6 days of the fed-batch culture of B. trispora with 2.5% of the dry cell weight, which was approximately 5 times higher than that of the batch cultures CT*dissolved oxygen; *surfactant; *sorbitan laurate; *beta carotene; *biotechnology; *protein synthesis; * fermentation; *fungus; *blakeslea trispora; glucose; foam; oxygen concentration; shear stress; bioreactor; fungus mutant; light exposure; oxidative stress; centrifugation; high performance liquid chromatography; mycelium; cell growth; nonhuman; article (sorbitan laurate) 1338-39-2; (beta carotene) 7235-40-7; RN (glucose) 50-99-7, 84778-64-3 ANSWER 5 OF 17 BIOTECHNO COPYRIGHT 2003 Elsevier Science B.V. on STN L81 DUPLICATE ACCESSION NUMBER: 1997:27485777 **BIOTECHNO**

AN 1997:27485777

BIOTECHNO

AB The influence of the oxygen and glucose supply on primary metabolism (fermentation, respiration, and anabolism) and

astaxanthin production in the yeast Phaffia rhodozyma was investigated.

When P. rhodozyma grew under fermentative conditions with limited oxygen or high concentrations of glucose, the

astaxanthin production rate decreased remarkably. On the other hand, when

the yeast grew under **aerobic** conditions, the astaxanthin production rate increased with increasing **oxygen** uptake. A

kinetic analysis showed that the respiration rate correlated positively with the astaxanthin production rate, whereas there was a negative correlation with the ethanol production rate. The influence of glucose

concentration at a fixed nitrogen concentration with a high level of oxygen was then investigated. The results showed that

astaxanthin production was enhanced by an initial high carbon/nitrogen ratio (C/N ratio) present in the medium, but cell growth was inhibited by a high glucose concentration. A stoichiometric analysis suggested that astaxanthin production was enhanced by decreasing the amount of NADPH required for anabolism, which could be achieved by the repression of protein biosynthesis with a high C/N ratio. Based on these results, we performed a two-stage fed-batch culture, in which cell growth was enhanced by a low C/N ratio in the first stage and astaxanthin

production was enhanced by a high C/N ratio in the second stage. In this culture system, the highest astaxanthin production, 16.0 mg per

liter, was obtained.

AN 1999:29160364 BIOTECHNO

AB Changes in the biosynthesis of carotenoids caused by altering the culture conditions of the yeast Rhodotorula glutinis No. 21 were investigated. Cells grown on lactate showed a higher production of torularhodin, one of the final products, compared with those grown on glucose, but no changes were observed as a result of adjusting the pH, at the start of the cultivation. These findings suggested that the difference in the carbon source was a factor giving rise to a change in the carotenoid biosynthesis system of R. glutinis No. 21. Increases in the contents of torulene and torularhodin were related to elevation of the dissolved oxygen concentration, which was adjusted by aeration. It was concluded that this yeast switches its system of carotenoid biosynthesis according to the extracellular conditions. The results obtained will contribute to elucidating the role of torularhodin in this non-phototrophic yeast which produces two carotenoids, .beta.-carotene and torularhodin, as the final products.

The effect of aeration rate and agitation speed on .beta.-carotene prodn. and morphol. of Blakeslea trispora in a stirred tank reactor was investigated. B. trispora formed hyphae, zygophores and zygospores during the fermn. The zygospores were the morphol. form responsible for .beta.-carotene prodn. Both aeration and agitation significantly affected .beta.-carotene concn., productivity, biomass and the volumetric mass transfer coeff. (KLa). The highest .beta.-carotene concn. (1.5 kg m-3) and the highest productivity (0.08 kg m-3 per day) were obtained at low impeller speed (150 rpm) and high aeration rate (1.5 vvm). Also, max. productivity (0.08 kg m-3 per day) and biomass dry wt. (26.4 kg m-3) were achieved at high agitation speed (500 rpm) and moderate aeration rate (1.0 vvm). Conversely, the highest value of KLa (0.33 s-1) was obsd. at high agitation speed (500 rpm) and high aeration rate (1.5 vvm). The expts. were arranged according to a central composite statistical design. Response surface methodol. was used to describe the effect of impeller speed and aeration rate on the most important fermn. parameters. In all cases, the fit of the model was found to be good. All fermn. parameters (except biomass concn.) were strongly affected by the interactions among the operation variables. .beta.-Carotene concn. and productivity were significantly influenced by the aeration, agitation, and by the pos. or neg. quadratic effect of the aeration rate. Biomass concn. was principally related to the aeration rate, agitation speed, and the pos. or neg. quadratic effect of the impeller speed and aeration rate, resp. Finally, the volumetric mass transfer coeff. was characterized by the significant effect of the agitation speed, while the aeration rate had a small effect on KLa.

AB Utilizing a four-liter fermentor and applying a complete factorial design 23, the combined effects of agitation speed, aeration rate, and corn steep liquor concn. on zeaxanthin prodn. by Flavobacterium sp. were studied.

Maximum growth and prodn. of total carotenoids and zeaxanthin were obtained at 600 rpm, 2 vvm and 4.6% corn steep liquor. Under these conditions, zeaxanthin represented 86% of the total carotenoids produced. Lower values of the variables studied resulted in lower growth, volumetric prodn. of zeaxanthin and total carotenoids, and favored the formation of other carotenoids such as .beta.-carotene and canthaxanthin. The pos. effects on growth and total carotenoids and zeaxanthin formation were in a large extent due to the interaction of agitation/corn steep liquor. However, aeration also had a pos. effect on growth.

INFO.: KR 1998-47930 Addn. of a surfactant in the medium to increase the prodn. of .beta.-carotene by a Blakeslea trispora culture causes foaming during fermn. An anti-foaming agent can be used to control foam, but it inhibits the growth of the fungi. Submerged aeration accompanied with surface aeration and control of stirring speed can be used effectively to control foam and increase the yield of .beta.-carotene from Blakeslea. In the fermn. process, the anti-foam agent, Span 20 is used to control foam. In addn. to anti-foam agent, submerged and surface aeration are applied to control foam. The total aeration rate is controlled in the range of 0.5-3.0 L air/L medium/min depending on the growth state of fungi. The speed of stirring is increased stepwise in the range of 10-100 rpm reached at 150-800 rpm depending on the increase of cell mass. The main source of carbon is glucose and the optimal concn. is kept under 70 g/L supplied intermittently. Pure oxygen is supplied to increase the dissolved oxygen in the medium. The final yield of .beta.-carotene is 17 g/L. **7235-40-7P**, .beta.-Carotene RL: BMF (Bioindustrial manufacture); BIOL (Biological study); PREP (Preparation) (prodn. of .beta.-carotene from Blakeslea trispora) ICM C12P023-00 IC 16-2 (Fermentation and Bioindustrial Chemistry) CC ST Blakeslea beta carotene fermn foam control IT Fermentation (fed-batch; prodn. of .beta.-carotene from Blakeslea trispora) IT Agitation (mechanical) Blakeslea trispora Foaming (prodn. of .beta.-carotene from Blakeslea trispora) IT **7235-40-7P**, .beta.-Carotene RL: BMF (Bioindustrial manufacture); BIOL (Biological study); PREP (Preparation) (prodn. of .beta.-carotene from Blakeslea trispora) IT 1338-39-2, Span 20 RL: BUU (Biological use, unclassified); BIOL (Biological study); USES (prodn. of .beta.-carotene from Blakeslea trispora)

AN 1998-467550 [40] WPIX

AB WO 9837179 A UPAB: 19981008

A process for the production of a valuable compound comprises: (a) fermentation of a micr bial strain of an industrial

fermentation of a micr bial strain of an industrial scale in a fermentation medium which is a chemically defined

medium composed of chemically defined constituents; and (b) recovery of

the valuable compound from the fermentation broth.

Also claimed is a method for preparing and/or improving a microbial strain producing a valuable compound of interest which is capable of being fermented on an industrial scale in a chemically defined medium, comprising: (a) subjecting a suitable parent strain to a mutagenic treatment selected from physical mutagens and chemical mutagens, and/or to DNA transformation; (b) screening the resulting mutants and/or transformants for their growth performance on a chemically defined medium and their production level of the valuable compound of interest; (c) selecting mutants and/or transformants which have a good growth performance on a chemically defined medium and/or an improved production level of the valuable compound of interest as compared to the parent strain.

USE - The method can be used for the production of valuable compounds such as beta-lactam compounds, enzymes, astaxanthin, arachidonic acid, triglycerides, beta-carotene, glucose isomerase (GI), clavulanic acid or erythromycin (claimed).

ADVANTAGE - The productivity of microbial strains in chemically defined media, when measured on an industrial scale, may be comparable to or in some cases even higher than their productivity in complex media. Oxygen transfer from the gas phase to the liquid phase and the carbon dioxide transfer from the liquid phase to the gas phase is improved substantially as compared to using complex media. The use of chemically defined media has a favourable influence on morphology, i.e. by producing a more rigid pellet which does not easily fall apart during fermentation. In addition, the chemically defined medium can decrease the viscosity of filamentous fermentation broths and improve downstream processing.

AN 1995-053688 [08] WPIX

AB EP 635576 A UPAB: 19950301

Bacteria belonging to a new genus and having the following properties are claimed: (1) morphology: polymorphic rod; (2) motility:motile; (3) flagella:peritrichous; (4) spore formation:none; (5) gram strain:negative; (6) prodn. of pigment:positive (water insoluble); (7) oxidase:positive; (8) catalase:positive; (9) behaviour toward oxygen:aerobic; (10) fermentation of glucose:negative; (11) prodn. of 3-ketolactose:negative; (12) quinone type:Q-10; (13) GC content of intracellular DNA:64-69 molar %; (14) formation of slime:glucose, negative; sucrose, negative; (15) presence of sphingolipid:negative; (16) presence of bacteriochlorophyll:negative.

USE - The bacteria can be cultured to produce one or a mixt. of carotenoid pigments selected from astaxanthin adonixanthin, beta-carotene, echinenone, canthaxanthin and zeaxanthin. The carotenoid pigments can be used as additives in food, feed, pharmaceuticals, cosmetics, etc.

ADVANTAGE - Using the bacteria, carotenoids can be produced on an industrial scale. They can produce natural type astaxanthin., Almost 100% of astaxanthin produced by the bacteria is (3S,3'S)-astaxanthin. Dwg.0/6

ABEQ US 5607839 A UPAB: 19970410

A new process for production of a **carotenoid** pigment selected from the group consisting of astaxanthin, adonixanthin, beta**carotene**, echinenone, canthaxanthin, zeaxanthin and mixtures thereof, comprising the steps of:

culturing bacterium strain E-396, FERM BP-4283, or A-581-1, FERM BP-4671, in an aqueous nutrient medium comprising sources of carbon, nitrogen, and inorganic substances and

recovering an individual carotenoid pigment or a mixture of the carotenoid pigments.

AB WO 9118108 A UPAB: 19960108

A continuous fermentation method for carotenoid

-producing heterotrophic microorganisms is claimed comprising (a) diluting a **fermentation** broth comprising the microorganism by continuously adding fresh **fermentation** medium comprising a nutrient to the **fermentation** broth so that the rate of addn. of the nutrient is less than that necessary to provide for a maximum growth rate of the microorganisms, (b) maintaining the pH of the **fermentation** broth at pH 5.5-6.5 and (c) maintaining the temp. at 30-38 deg.C.

The pref. microorganisms are algae of the species Neospongiococcum excentricum (ATCC40355). The nutrient is pref. glucose or sucrose. The fermentation broth pref. contains greater than 10% dissolved oxygen and the partial pressure of CO2 in the broth is pref. less than 0.04.

USE/ADVANTAGE - The process provides a high level of growth and productivity over an extended period of time. In particular, xanthophylls can be produced at levels of at least 20 mg/l/hr. The xanthophylls are useful as natural colouring agents, esp. as feed supplements for poultry. @(28pp Dwg.No.0/0)

AB SU 413183 A UPAB: 19930831

In the title **culturing** when thre air input is 0.3-3.0 vols/vol. medium per min., the stirring rate is increased in steps, and when the exit gas inhibiting CO2 concn. is 3-11% the stirring rate is cut stepwise with increase also in air supply. In the case of the lysin producer Brevibacterium sp. 22, at an air speed 1.2 vols/vol. medium/per min., the stirring rate steps are 180, 230, 280, 330, 380 r.p.m., and when the exit gas CO2 conc. is 4% the stirrer speed sequence is reversed. With the **carotenoid producer** Rhodotorula gracilis Mn, using an air input of 2.0 vols./vol./min., the stirring speeds are 200, 300, 400 r.p.m., then with 11% CO2 in the exit gas the sequence is reversed.

Carotenoid-contg. concentrates useful in the prodn. of fodder prods. and in the food and medicinal inds. are produced by cultivating carotenoid-producing micro-organisms under aerobic conditions on a nutrient medium contg. sources of C, N, mineral salts, biologically active substances, stimulants and carotenoid precursors until maximal accumulation of the biomass in the fermentation medium, effecting a partial separation of the fermentation medium from the biomass to give a biomass conc. of is not <50 g (dry wt) per litre of medium, and accumulating carotenoid by maintaining the concentrate (optionally after adding carbohydrate and/or trace elements) at 28-35 degrees C and pH 5-7 while aerating at a rate of 80-150 mg

O2/litre/minute. Fermentati n time is shortened energy requirements are reduced, and the capacity and amt. of equipment required are less

AB A process for the microbial manuf. of carotenoids of desired ratio of carotenoid compds. with bacteria E-396 and A-581-1 which have low growth rate and enable easy isolation of the carotenoids was given. The ratio of the carotenoid compds. (i.e., astaxanthin, adonixanthin, .beta.-carotene, echinenone, canthaxanthin, zeaxanthin, .beta.-cryptoxanthin, 3-hydroxyechinenone, adonirubin, etc.) is controlled by the concn. of oxygen dissolved in a lig. culture medium during the fermn.

     The strain E-396T, isolated from soil, was Gram-neg., aerobic,
     orange-pigmented, rod-shaped, motile by peritrichous flagella and
     astaxanthin-producing. This organism produced carotenoids.
     mainly astaxanthin, and did not produce bacteriochlorophyll.
     ubiquinone system was Q-10. Anal. of the 16S rRNA sequence of strain
     E-396T showed it to be a member of the .alpha.-3 subclass of the
     Proteobacteria, forming a cluster with the species of the genus
     Paracoccus. On the basis of the prodn. of orange pigments and motility by
     peritrichous flagella, together with DNA-DNA reassocn. data, it is
     concluded that the new isolate should be classified into a new species of
     the genus Paracoccus, Paracoccus carotinifaciens sp. nov. The type strain
     is E-396T ( = IFO 16121T).

INFO.: A 19930722 US 1994-276943 A3 19940719 Bacterium belonging to a new genus, and a process for prodn. of carotenoid pigment selected from the group consisting of astaxanthin, adonixanthin, .beta.-carotene, echinenone, canthaxanthin and zeaxanthin, comprising the steps of culturing a bacterium capable of

carotenoid pigment selected from the group consisting of astaxanthin, adonixanthin, .beta.-carotene, echinenone, canthaxanthin and zeaxanthin, comprising the steps of culturing a bacterium capable of producing at least one of the carotenoid pigments, and recovering an individual carotenoid pigments. The producer bacterium belongs to new genus. According to the present process various carotenoids can be produced in an industrial scale. By the present process (3S, 3'S)-astaxanthin can be produced in an almost 100% purity.

      This sequence represents the 16S rRNA gene from anew species of microbe, B-396 (FERM BP-4283). The microbe is a gram negative pleomorphic rod shaped motile microbe which is aerobic. The GC content of the intracellular DNA is 64-69%. The microbe may be in the production of all-trans astaxanthin in high yield.

                               the present invention accounts a minimum. The present invention of carotenoid compounds at a specified or varying, ratio by controlling the concentration of oxygen dissolved in the liquid medium during culture. The produced carotenoids are natural pigments, which are use in feed additives, food additives and pharmacenticals. The ratio of carotenoid, compounds obtained can be controlled by varying the concentration of oxygen dissolved in liquid medium during culture. The present sequence represents a specifically claimed 16s ribosomal gene from an unknown organism designated E-396, from the present

                                                                                                                                                                                                                9
                                                                                                                                                                                                                                9
                                                                                                 This DNA sequence encodes a 16S rRNA isolated from a new genus of bacteria, designated E-396. This bacterium is capable of producing carotenoid pigments selected from astaxanthin, adonixanthin, betacarotene, etc. The carotenoid pigments can be produced in industrial quantities and used for feed additives.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       75
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                           This is the nucleotide sequence of the 16S ribosomal RNA gene of Paracoccus marcusii type strain DSM 11574 (also named Paracoccus strain MHI). The 16S rRNA gene can be used to identify this novel Paracoccus species. P. marcusii appeared as a single orange colony contaminating a nutrient agar plate. It produces and secretes carteenoids such as beta-carotene, echimenone, beta-cryptoxanthin, adonizubin, cis-adonizanthin, adonizanthin in vesicles. A process for producing such astranthin and zeaxanthin in vesicles. A process for producing nutrient medium including sources of carbon, nitrogen and inorganic substances, and recovering an individual carotenoid pigment or a mixture of carotenoid pigments from cells, vesicles and/or medium. The carotenoid sare useful as additives for human foods or animal feeds (e.g. in salmonid fish farming) or cosmetics, and provides a ready source of carotenoids that are currently very expensive to synthesise or to extract from natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CAGAACGAACGCTGGCGGCAGGCTTAACACACATGCAAGTCGAGGGCGAGACCTTCGGGTCTAG

                                                                                                                                                                                                                                                                                                            The present invention describes a microbial method for producing carotenoid compounds at a specified, or varying, ratio by controlling the concentration of oxygen dissolved in the liquid medum during culture. The produced carotenoids are natural pigments, which are useful in feed additives, food additives and pharmaceuticals. The ratio of the carotenoid compounds obtained can be controlled by varying the concentration of oxygen dissolved in liquid medium during culture. The present sequence represents a 165 ribosomal RNA gene from an unknown organism designated A-581-1 which is given in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   423

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                  The invention relates to a selenic acid reducing microbe FERM BP-5662 that belongs to Paracoccus genus. It has the ability of reducing 6-valent selenium (8e). Also provided is a method for waste water treatment comprising removing Se from waste water by reducing Se from 6-valent to 4-valent (optionally to an Se simple substance) by microbe (as above) treatment on the active sludge to separate the solid from the liquid. The microbe is useful in water treatment to remove (6-valent) selenium. The microbe is more efficient at removing 6-valent selenium prior art methods. The present sequence represents the nucleotide sequence of 16S rRNA that is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180

                                                                                                                                                                                                                                                                       The present invention relates to a new beta-hydroxybutyric acid producing microorganism Paracoccus kawaakiensis (FERM P-17644, BP-7059). The new microorganism has properties of paracoccus sp., is unable to grow in a medium containing 0.3% or more of sodium chloride, unable to assimilate potassium nitrate or glutamic acid, but is able to assimilate ammonium sulphate as a nitrogen source. Also, the microorganism has ureasse activity, but is unable to assimilate exylose, mannitol, maltose or lactose. The microorganism is able to assimilate arabinose and sucrose as sole carbon sources. The microorganism is useful for the production of beta hydroxybutyric acid (PHB) and treatment of waste water and reduction of nitrate and removal of nitrogen in waste water. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             543
                                                                                                                                                                                                                                                                                   The invention relates to a novel bacterium, designated SH134-8 in the specification, which is able to decompose the nitrogen-containing sulphur compound HADS (hydroxylaminedisulfonic acid). Bacterium SH134-8 (FERM P-17192) is an aeroble heterotrophic Gram-negative bacterium which is non-motile and has no sugar-assimilating ability. Bacterium SH134-8 as had for decomposing a nitrogen-containing sulphur compound such as HADS in a cost-effective manner e.g., for environmental decontamination. The present sequence represents DNA encoding 16S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  63

                                                                                                                                                                                                                                                                                                                                                                                                 4
                                                                                                                                                                                                                                                 The invention relates to a polynucleotide specific to a HADS decomposing microorganism, and detection and determination of a HADS decomposing microbe using the polynucleotides of the invention. Nucleotides of the invention are useful as probes or primers. The method is used for detecting or determining a HADS decomposing microbe. The current sequence represents a polynucleotide sequence specific to a HADS decomposing

The present sequence is that of a Rhodopseudomonas 16S rDNA sequence, useful to the invention. 65 CTCCTACGGGAGGCAGCAGTGGGGGAATCTTAGACAATGGGGGGCAACCCTGATCTAGCCAT GCCGCGTGAGTGATGAAGGCCTTAGGGTTGTAAAGCTCTTTCAGCTGGGAAGATAATGAC GCTAGCGTTGTTCGGAATTACTGGGCGTAAAGCGCACGTAGGCGGACTGGAAAGTCAGAG GGTACCAGCAGAGAAGCCCCGGCTAACTCCGTGCCAGCAGCCGCGGGTAATACGGAGGGG 658 GGCGAAGGCGGCTCACTGGCTCGATACTGACGCTGAGGTGCGAAAGCGTGGGGAGCAAAC **AGGATTAGATACCCTGGTAGTCCACGCCGTAAACGATGAATGCCAGACGTCGGCAAGCAT** AGITIGALCCIGGCICA-GAACGAACGCIGGCGCAGGCTIAACACACAIGCAAGICGAGCG 60 AGACCTTCGGGTCT--AGCGGCGGACGGGTGAGTAACGCGTGGGAACGTGCCCTTCTCTA CGGAATAGCCCCGGGGAAACTGGGGAGTAATACCGTATACGCCCTTTGGGGGAAAGATTTAT GCTAGCGTTGCTCGGAATCACTGGGCGTAAAGCGCACGTAGGCGGCTTTCTAAGTCAGGG GTGAAATCCCAGGGCTCAACCTTGGAACTGCCTTTGAAACTATCAGTCTGGAGTTCGAGA 598 GAGGTGAGTGGAATTCCGAGTGTAGAGGTGAAATTCGTAGATATTCGGAGGAACACCAGT Gaps 1484; 27; Length 718

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                         1 agtttgatcctggctcagaa.........tgcggctggatcacctcctt 1452
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

Patent No. 5935808
GENERAL INFORMATION:
APPLICANT: JOSEPH HIRSCHDERG. and Mark Harker
TITLE OF INVENTION: NOVEL CAROTENOID-PRODUCING BACTERIAL
TITLE OF INVENTION: SPECIES AND PROCESS FOR PRODUCTION
TITLE OF INVENTION: OF CAROTENOIDS USINGSAME
NUMBER OF SEQUENCES: 1
CORRESPONDENCE ADDRESS: t converted Sheinbein microdisk MEDIOM TYPE: 1.44 megabyte, 3.5" microdis)
COMPUTER: Twinhead* Slimnote-890TX
COMPUTER: Twinhead* Slimnote-890TX
OPERATING SYSTEM: MS DOS version 6.2,
OPERATING SYSTEM: Windows version 3.11
SOFTWARE: Word for Windows version 2.0 cor
SOFTWARE: an ASCII file
CUSTRANT APPLICATION DATA:
APPLICATION NUMBER: US/08/902,518A Robert

Patent No. 6030818

GENERAL INFORMATION

APPLICANT: PAGI, Michel

APPLICANT: BOISSINOT, Mautice

APPLICANT: HILLE, Marie-Claude

APPLICANT: HARDEY, Marie-Claude

APPLICANT: HARVEY, Marie-Claude

APPLICANT: HARVEY, Marie-Claude

TITLE OF INVENTION: BACTERIAL MASS PRODUCTION

TITLE OF INVENTION: OF TAXANES AND PACLITAXEL

NUMBER OF SEQUENCES: 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        E: Dike, Bronstein, Roberts & Cushman,
